"K/FLK-1: a putative receptor protein tyrosine kinase isolated from embryonic neuroepithelium is expressed in endothelial cells of developing embryo.";

Ocene 8.11.76.76.7.";
                                                                                                                                                               TYPOSINE PHOSPHATE.

SUBCELLULAR LOCATION: Type I membrane TISSUE SPECIFICITY: EXPRESSED AT HIGH KIDNEY, BRAIN AND SKELETAL MUSCLE, BUT LEVELS IN MOST OTHER ADULT TISSUES.

SIMILARITY: Belongs to the Tyr family CSF-1/PDGF receptor subfamily.
                 s SWISS-PROT entry is copyright. It is produced through a collaboration ween the Swiss Institute of Bioinformatics and the EMBL outstation - Buropean Bioinformatics Institute. There are no restrictions on its by non-profit institutions as long as its content is in no way
                                                                                                                                          SIMILARITY: Contains 7 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                         VASCULAR PERMEABILITY.

CATALYTIC ACTIVITY: ATP + a protein tyrosine =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and functional analysis of the promoter for KDR/flk-1,

TISSUB SPECIFICITY: Found in the basement membranes.
PTM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS N-LI
AND O-LINKED OLICOSACCHARIDES.
DISEASE: Defects in HSPG2 are the cause of Schwartz-Jampel
syndrome (SJS1) [MIM:255800]; a rare autosomal recessive d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells. SUBUNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type
                                                                                                                                                                                                                                                                                       non-profit institu

Event=Alternative initiation;

Comment=2 isoforms, A (shown here) and B, are produced by alternative initiation at Met-85;

I successful in the subryo, expressed at high levels in the developing brain and neural tube. In adult, highly expressed in brain with very low levels found in testis, heart and thymus. I soform C is expressed only in the embryo.

I soform C is expressed only in the embryo.

DEVELOPMENTAL STAGE: Low levels in early gestation. Highest levels expressed during mid gestation. Levels decrease in late gestation and remain at this level in the adult.

SIMILARITY: Belongs to the immunoglobulin superfamily. DCC family.

SIMILARITY: Contains 4 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-NOV-1997 (Rel.

"Identification of cDNA clones encoding different domains of the 
"Identification of cDNA clones encoding different domains of the 
basement membrane heparan sulfate proteoglycan.";

J. Biol. Chem. 263:16379-16387(1988).

-i. FUNCTION: This protein is an integral component of basement 
membranes. It is responsible for the fixed negative electrostatic 
charge and is involved in the charge-selective ultrafiltration 
properties. It serves as an attachment substrate for cells. 
properties. It serves as an attachment substrate for cells.

-i. SUBUNT: Purified perlecan has a strong tendency to aggregate in 
dimers or stellate structures. It interacts with other basement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWI

"Cloning and identification of human neurotrimin full length cDNA."
Submitted (FEB-1999) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: Neural cell adhesion molecule.
-I- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
-I- SIMILARITY: Belongs to the immunoglobulin superfamily. IGLON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   InterPro; IPR007110; I

EMBO J. 16:978-988(1997).

- FUNCTION: MEDIATES CELL SURFACE INTERACTIONS DURING NERVOUS SYSTEM
- DEVELOPMENT. IN ASSOCIATION WITH CNYNAPI SEEMS TO PLAY A ROLE IN
THE FORMATION OF PARANODAL AXO-GLIAL JUNCTIONS IN MYELINATED
PERIPHERAL NERVES AND MAY HAVE A ROLE IN THE SIGNALING BETWEEN
AXONS AND MYELINATING GLIAL CELLS.
- SUBUNIT: INTERACTS WITH CONTACTIN ASSOCIATED PROTEIN 1 IN CIS
FORM. BINDS TO THE CARBONIC-ANHYDRASE LIKE DOMAIN OF PROTEIN-
TYROSINE PHOSPHATASE ZETA.
- SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
- SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
- SIMILARITY: Contains 4 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             is a functional ligand
contactin.";

I'Immunochemical characterization of two isoforms of rat liver ect

T ATPABE that show an immunological and structural identity with a

T glycoprotein cell-adhesion molecule with Mr 105,000.";

L Biochem. J. 278:155-161(1991).

C -!- FUNCTION: THIS PROTEIN IS A CALCIUM-INDEPENDENT CELL ADHESION

MOLECULE WITH HOMOPHILIC BINDING PROPERTIES. MAY PLAY A ROLE

THE FORMATION AND MAINTENANCE OF THE SPECIALIZED MEMBRANE

STRUCTURE OF THE APICAL SURFACE OF THE HEPATOCYTES.

C -!- SUBGELLULAR LOCATION: TYPE I MEMBRANE PROTEIN. CANALICULAR DC

OF HEPATOCYTE PLASMA MEMBRANES.

-!- ALTERNATIVE PRODUCTS:
